2 Recycle Energy

Energy savings is some simple actions you can take, in order to reduce the damage to the environmental. Recycling energy will cause a decrease in the need for new energy and this is the number one save. Every BTU of energy, the modern world is producing, damaged the source of the energy (coal, fuel, wood etc) and damaged the environment. BTU (The British thermal) is a global term for energy unit, used in the power, steam generation, heating and air conditioning industries.

Recycling is another world for energy saving because each product you can recycle, will take much less energy than making new one. When you recycle paper for instant, you use lots of energy and water. For recycling the same amount of paper, only half of the power is needed and even less than half of the water. Saving the production energy do not include the great save of 17 trees for each ton of recycled paper.

So many ways to save energy and to produce alternative energy:

- Bio fuels
- Biomass
- Geothermal
- Hydro power
- solar power
- Tidal power
- Wave power
- Wind power

Adopt the recycling energy and energy save way of life and enjoy better, cleaner and healthier planet for you, for your children.
